

## Before you begin planting:

If your pot has holes in the bottom, please be sure to place it on a saucer or tray large enough to encompass the bottom.

## **Planting Instructions**

- 1. Place media block into pot and add warm water. Each media block requires 2 to 2 ½ cups of warm water to expand. It is recommended to start with the minimum amount of water and add additional if needed. Once expanded, fluff media.
- 2. Once media has been prepared, plant bulb with approximately the top 1/3 of the bulb showing above the media surface. Media should be moist and additional water should not be needed at this time.
- 3. Keep the amaryllis in a warm location (70-75°F), but not in direct sunlight.

- 4. Water regularly throughout the flowering period. Keep the media moist but not soggy. **DO NOT OVERWATER.**
- 5. After flowering, remove the flower stem just above the bulb and continue to water regularly.
- 6. In the spring, plant outdoors and fertilize throughout the summer. After the first frost, dig the bulb up and store bulb in a cool dark place for at least 8 weeks. Then, repot the bulb and a new cycle will begin.
