The automatic drain valve removes condensed water and oil from compressed air systems without restricting air flow, creating pressure drops or opening the system to the atmosphere. Its unique design maintains systems pressure and volume during operation, and increases productivity.

* The high capacity reservoir gives the automatic drain valve twice as much condensate storage capacity during the pumping cycle. This larger reservoir is available as an upgrade. A larger reservoir is recommended for use on heavily-loaded simplex compressors with long pumping cycles and/or operating in extremely humid environments. If the pumping cycle exceeds one hour, then an electric timer kit should be used.

AUTOMATIC DRAIN VALVE TIMER KITS

An automatic drain valve timer kit resolves application problems in which an existing automatic drain valve cycles too infrequently. A timer generates the pneumatic signals for actuating the automatic drain valve. With a timer, the automatic drain valve operates independently of the compressor unload cycles.
