

"Every year I use Lucky Buck in the beginning of February so that my deer get optimal mineral consumption. It works for your does in helping there prenatal care and as far as the bucks go--well take a look at my picture. I have been using lucky buck for 5 years now."  
Shawn K., Pennsylvania

Meet the Amish Lucky Buck  
On opening day, Jonathon took a massive 36 point buck with a crossbow. Because he was eating Lucky Buck, Jonathon appropriately named him the 'Amish Lucky Buck'. This huge buck's green score was 304 gross — with deductions it scored a 294<sup>7</sup>/<sub>8</sub>. The inside spread was 24" as confirmed by the Ohio Department of Wildlife in 2006.

"I have been feeding Lucky Buck for 4 years now. He was a 3 1/2 year old deer. His inside spread measured 21 3/8 inches."  
Aaron D, Ohio

## Bigger Bucks for Just Pennies a Day!

### From Holsteins to Whitetails.

For years, livestock farmers have been doing an excellent job supplementing minerals to their cattle to make them more productive. Hunters, on the other hand, want their deer herd to be more productive but the deer's only source of food is what they find in the wild. This source is low in the same trace minerals that our cattle feed is low in. Ask any dairy or livestock farmer what his cattle performance would do without even a few of these key trace minerals they supplement. Most would agree their livestock would not be able to maintain production and the herd's health would suffer. I realized these same minerals would be beneficial to the deer population. Mar-Vo Minerals Co. Inc. has been making livestock minerals for almost 100 years now. In 1995, I purchased the company and a year later began making **Lucky Buck Mineral!**

**Lucky Buck Mineral** is developed so that deer will love the taste yet they will only eat what they need. Many competitor mineral mixes contain grain by-products or molasses causing hungry deer to overeat. When this happens, the supplement is gone before the more elusive bucks you want to improve get any.

**Lucky Buck** is a consistently proven product that is working. None of the pictures have been altered. Vic Bulliner's buck (shown on front) had over 13 pounds of antlers which he grew in only a few months!

If the whitetails on or around your property don't have much bigger racks (and you're the judge) after feeding **Lucky Buck** for 2 years, year-round, **WE WILL GIVE YOU YOUR MONEY BACK... GUARANTEED!**

Happy Hunting

David Wheeler  
President, Mar-Vo Mineral Co., Inc.

**Pick up your bucket of Lucky Buck Mineral today!**

- Won't spoil in rain or snow.
- Strengthens deer bones prior to antler growth.
- Works as a fall attractant so deer will return, year after year.

B & C 180<sup>3</sup>/<sub>4</sub> net. World record 8 point with the longest main beams in the book for any whitetail. Fed **Lucky Buck** for 3 years.

"My friends and I hunted the same property since 1976. The biggest buck we killed on the property before 2001 was in the 110" class. The only change was to start feeding Lucky Buck in the spring of 1999 on adjoining properties. Lucky Buck has been fed ever since."  
Vic Bulliner

"20 point road kill buck. Fed Lucky Buck one year in a 7 acre patch of woods. Scored 183 as a 3 year old." Benjamin D, Ohio

"We've been using Lucky Buck on our farm for 3 years and can tell the difference in the antlers and body size of our deer. They have a lot more mass than neighboring farms' deer. We took our deer to our local taxidermist and it was interesting to see the difference in the antler mass of our deer compared to the other deer in our area." Cheyenne D., Missouri

"I used your product for the first time this year and was a little skeptical as anyone should be trying something new. I hunt in Tennessee. I got several good deer on camera throughout the summer and this deer season I got the second biggest buck I had seen on camera hitting my Lucky Buck sight. I'm gonna keep using Lucky Buck and see how it helps the deer herd I'm hunting." Alexander A., Tennessee

"Five years ago since we started using Lucky Buck, I have seen a significant improvement of quality bucks from our area. Highly recommend Lucky Buck mineral for future success of great quality bucks." Eric G., Michigan

"Just moved here in February and did not think I would even have the chance to put a tag on a deer this year. But from early June until the last evening of muzzle loader, Lucky Buck kept my biggest buck I've killed where I needed him to be! Thanks for an awesome product!" Lance E., Kentucky

# Lucky Buck™

## Why use minerals?

Three factors impact antler size:

- AGE
- GENETICS
- NUTRITION

## Why use Lucky Buck Minerals? BECAUSE IT WORKS!

Other deer supplements contain large quantities of bitter tasting minerals — phosphorous, magnesium and potassium. These minerals are known to be in the makeup of an antler, but in most areas are not limiting antler growth because of their prevalence in the forages the deer consume. And, if they are included in a supplement their bitter tastes must be masked with other things that spoil and cause overeating.

Lucky Buck Mineral is specially formulated for wild whitetail and contains none of these bitter tasting minerals.

For more information, contact us at **MAR-VO MINERAL CO.** • 115 E Bacon Street, Hillsdale MI, 49242 • 888-816-2786 • [www.lucky-buck.com](http://www.lucky-buck.com)

- 1. AGE:** Age is always a factor and usually the most important! It is difficult to improve the age structure but worth the effort. **LET THEM GROW!**
- 2. GENETICS:** Every area has good genetics and poor genetics. Much blame or credit for antler size falls on genetics. Actually, environmental factors like natural soil fertility, high protein crops, natural minerals or age structure are the reason some areas produce larger bucks. You have very little impact on genetics by management! Whatever state or country you are in can produce big bucks!
- 3. NUTRITION:** Energy is usually not a major limitation to antler size unless food supplies are short enough to cause overly thin deer or do not allow bucks to recover body weight loss during rut. Protein is very important for antler size but is expensive to supplement because it requires intensive feeding or planting. Many areas that have commercially grown beans and intensively cut hay have all the protein they need. Minerals are easy to administer, just dump it out and compare it to an intensive feeding or planting program. Feeding minerals is very economical and results are dramatic... in just one season.

### Lucky Buck HAS THE MINERALS DEER DON'T FIND BITTER.

More importantly, it is formulated to limit the amount of minerals the deer will eat. This does two things: it allows us to safely put in extremely high levels of key trace minerals that are crucial for antler growth, and saves you money because the deer eat very limited amounts. Usually the deer will only eat about 1.5¢ of **Lucky Buck Mineral** each day for the whole year. **With 20 deer on your property, feeding Lucky Buck Mineral will cost less than half the price of a soft drink or cup of coffee per day!**

"My father and I have been buying your product for many years and it's been phenomenal on what growth we've seen year after year, from watching a two year old grow to a brute at 4 1/2 years old. Lucky Buck WORKS!! Everyone wants big bucks, that's what keeps the anticipation going every season. With Lucky Buck it's a guarantee for producing big mature bucks. You just have to manage the property and watch them grow. The earlier the better, I always say, for setting up trail cams and throwing out a bucket or two of Lucky Buck. It doesn't take long for the deer to find the strong aroma of apples the mineral puts off. It's almost like you opened an apple-flavored pixi stick, it smells so good... a polite punch in the face when you crack open the lid (haha)! I was impressed to see how fast the nose of the whitetail found the mineral once you set up a camera. I've learned they will come when their bodies need it... maybe a doe nursing two fawns late summer and she needs the nutrition to keep herself healthy, or the bucks that need it when they are carrying those massive racks mid summer!" Matt M., Ohio

## Use Only 6 Buckets Per Site\* for the Entire Year.

Coincide Lucky Buck Mineral usage with the antler growth cycle for best results.

Follow this simple time-line and plan on bigger racks this fall.

**LATE WINTER**  
1/3 bucket per site. Then go find some sheds.

**GROWING SEASON**  
**GET THOSE TRAIL CAMERAS OUT!** When the grass begins to grow, dump a full bucket on each site, then mow your lawn. Deer will consume an average of one bucket per site per month between green-up and the end of July. When antlers are done growing, consumption will naturally drop off.

**AUTUMN**  
Freshen up your trail camera site as they use it — 1/3 bucket every couple months. After hunting season, recharge each site with 1/3 bucket to help the deer through the rest of rut and into winter.

\* Estimates based on 25 deer per site.
