

Please note that this hydraulic top link has British Standard Pipe (BSP) threads in the double piloted check valve. BSP is the standard pipe threading worldwide, with the exception of the United States. NPT, or National Pipe Thread, is most commonly used in the US. The cylinder comes with two BSP to NPT adapters, unless it is purchased with an AMA hose kit part number 67852 OR 67852BT, in which case no adapters are needed due to the BSP threads in the hoses. Please remember you will probably need the adapters when attaching an existing hose kit from your tractor to the top link. There are also two rubber seals under the plugs in the check valve that must be removed before hooking up hoses or adapters to the top link.
