

# PASTURERX

## Your Prescription for Healthier Pastures

Featuring Yellow Jacket® Enhanced Seed Coating for improved germination and reduced water consumption

### Simple

Ideal for repairs, quick germination and fast, sustainable growth

### Balanced

Excellent nutritional content; highly digestible and palatable

### Proven

Backed by research to sustainably thrive where other products fail

**Seeding Rate:** 23 lb/acre

PastureRX is a balanced mixture of grasses, and legumes. These modern varieties were developed through standard breeding and selection practices, and are not GMO's.

PastureRX will establish quickly, producing highly palatable, high-quality pasture that competes with undesirable species when appropriately managed.

# EASY PLANTING INSTRUCTIONS:

- 1 Success depends on creating good seed-to-soil contact at planting, soil moisture after planting and controlling competition from existing vegetation. Testing the soil fertility for deficiencies and correcting deficiencies will improve results.
- 2 Timing: Can be planted in late winter/spring or late summer/fall, depending on geographic location. Needs 60 days of growth before a hard killing frost.
- 3 Reduce existing vegetation by close grazing, mowing or proper herbicide application.
- 4 Disturb the pasture soil surface. This can be accomplished by dragging a device like a drag or disc harrow, or by home-made devices like a weighted section of chain-link fence, or a shipping pallet.
- 5 Spread PastureRX by hand broadcasting, the use of a handheld or pull-type broadcast spreader, or pasture drill. Do not plant seed too deep, ¼ to ½ inch seed depth is all that is needed. After broadcasting seed, light dragging and/or rolling will enhance seed-to-soil contact.
- 6 Mow pasture to prevent existing vegetation from outdeveloping new seedlings.
- 7 Pasture can be grazed once seedlings are firmly rooted, and the seedling plants have reached 4-8 inches in height.

## Yellow Jacket Enhanced Seed Coating:

Yellow jacket® is an exclusive seed enhancement. It improves seedling establishment under marginal conditions and produces improved plant growth even after establishment.

## How Quickly Can you Graze It:

Can be lightly grazed as soon as plants are rooted firmly. Test by grasping plants and pulling. If the leaves tear off while the plant remains anchored in the ground, it can be grazed.

## Chemical Recommendations:

Consult product labels for guidelines on planting following application or consult your local chemical specialist.

## How Fast Will It Establish:

Components will germinate in 7-10 days with sufficient soil moisture. Dry soil conditions will delay germination.
