

Setting the Deadset™ Mole Trap

1. Water the lawn and active area thoroughly!
A wet lawn keeps the mole's food supply close to the surface and makes it easy to place the mole trap in the ground.

2. Locate the active tunnels. Poke a 1" hole in the raised earth through to the tunnel. Wait 24 hours. If the hole is resealed, the tunnel is active.

3. Press down on the raised earth with your foot, depressing the tunnel roof. Press the trap into the softened ground, then use **FOOT PEGS** to firmly set the trap in place.

4. Raise and lower the **HANDLE** until the **SPEARS** move freely through the ground, making sure that nothing will get in the way of the **SPEARS** when the mole trips the trap.

5. With feet on **FOOT PEGS**, raise **HANDLE** to set the trap.

Use multiple traps
for improved success.
