

Amaryllis

Before you begin planting:

If your pot has holes in the bottom, please be sure to place it on a saucer or tray large enough to encompass the bottom.

Planting Instructions

1. Plant bulb in potting soil with approximately the top 1/3 of the bulb showing above the soil surface.
2. Keep the amaryllis in a warm location (70-75°F), but not in direct sunlight.
3. Water regularly throughout the flowering period. Keep the media moist but not soggy.
DO NOT OVERWATER.
4. After flowering, remove the flower stem just above the bulb and continue to water regularly.
5. In the spring, plant outdoors and fertilize throughout the summer. After the first frost, dig the bulb up and store bulb in a cool dark place for at least 8 weeks. Then, repot the bulb and a new cycle will begin.
