

DETOUR GEL

Rodent & Insect Repellent

Eliminate Rodents & Insects from a Restaurant or Food-Production Area Fast!

OPEN-AIR RESORT RESTAURANT KITCHEN IN CANCUN, MEXICO

- Open-air restaurant with easy entry for rats and cockroaches.
- The facility was fumigated in the past but with no success in stopping rats and cockroaches.
- DeTour Gel was applied on the fryer & stove in an extra thick line.
- DeTour Gel did not melt in this hot environment and was left in place for only one week.
- After one week, the rat and cockroach problem was solved. Neither pest reappeared.

“After two days the product even next to the fire has the same consistency. You can’t believe it, but even here the cucoraches were in this place even the owners had fumigate and put other products. After two days the owners were astonish because THEY DIDNT FIND ANY excrement of rats and cucaraches.”

Cancun Restaurant Manager

“We apply it in a part of the oven where it was A LOT OF cocoraches in a zig-zag. We know we apply too much, but this was before asking you how to do it right.”

Cancun Restaurant Manager

EGG-PRODUCING CHICKEN HOUSE DURING THE WINTER IN THE PACIFIC NORTHWEST

- Chickens are housed on the second floor of a structure that is supported by wooden beams from the ground.
- DeTour Gel is applied around the support beams to stop rats and beetles from going up from the ground to where the chickens are located.
- Notice how the beetles are stopped below the horizontal line of DeTour Gel.
- Before the DeTour Gel was applied, the entire support beam was covered in black with darkling beetles.
- DeTour Gel stays in place on the pole while remaining potent in a cold, damp environment.

“No darkling beetles have climbed above the Detour Gel line!”
