

The Legacy Blueberry is a northern highbush variety, growing well in northern regions with cooler climates. The Legacy is a vigorous and productive grower, with medium to large size blue, firm berries. The USDA has rated the Legacy Blueberry as one of the most flavorful on the market, making a popular producer. Fruit ripens in August, with white blossoms in spring. In the fall a beautiful orange color adds contrast to your edible landscape. Legacy berries are great for fresh eating, baked goods, in preserves or jams, frozen or dehydrated. A self-pollinator, but planting with another northern highbush variety will produce larger crops.

- Includes one Legacy Blueberry fruiting bush in a #2 pot and detailed planting instructions.
- Moderate growth rate, with stunning white blossoms in spring.
- Ripens in August.
- Self-pollinator, but will produce larger yields with cultivator.
- Best grown in USDA Hardiness Zones 5-8.
- Plant in full sun.
- Prefers loamy, well-drained soil.
- Mature height of 4-6 ft with a mature spread of 3-4 ft.
- #2 size pot has actual size of 5.68 Liters/1.5 gallons

Below are general planting instructions.

1. Remove tree and soil mix from plastic container.
2. Dig hole twice the width of pot and as deep.
3. Place roots, surrounded by potting soil from container, in the middle of hole. The top of potting soil should be slightly above ground level, as the plant will later settle. Be careful to not plant too deep as this will suffocate the root system.
4. Ensure the roots are not tightly compressed. Use your fingers or blunt instrument to loosen the potting soil/roots and spread gently to encourage outward growth into the surrounding earth.
5. Use soil that was removed while digging to fill hole back, but remember to only fill to top level of soil mix that is around plant.
6. Water soil, allow it to settle and add more soil if needed. Tamp lightly. (Tamp, for the majority of us who might not know, means to tap the soil with light to medium blows repeatedly.) This will help soil to settle.
7. Water plant again. Adding mulch around plant in a 1-2" layer will help retain moisture. If experiencing hot or dry weather it will be important to water plants more frequently, versus the recommended 1-2 times a week to water thoroughly.

Please review the recommended USDA Zones for your area. It is important to select plants with recommendations for your zone; otherwise, they will not be successful in your landscape due to their inability to grow in those weather conditions.
