

INSTRUCTIONS:

1. Only use Catapult recovery rope for vehicle recovery. Check to make sure the rope is strong enough for the vehicle that is stuck along with the payload it is carrying. The total weight should be at less than 1/3 the breaking strength of the rope you are using. It is the user's responsibility to ensure the rope is used correctly for the right application. Improper use can result in injury, death and property damage.
2. The rope needs to be straight without any twists before attaching to both vehicles. Attach rope to the stuck vehicle before attaching to the recovery vehicle. Make sure there are no sharp objects between the two vehicles to prevent damage to the rope.
3. Only attach the shackles on the black fabric sleeves on the end of the rope. Use factory approved towing points on the vehicles – i.e. eye loops are generally on the front and back of the bottom side of the vehicles. Check the owner's manual of both vehicles to confirm approved towing points. Shackles with the same or greater load capacity are to be used to connect the rope to the towing points.
4. Never use a bumper or tow hitch. This can slip off and cause damage to the vehicles and injure anyone within range.
5. Make sure no one is within range of the rope at all points of the vehicle recovery
6. Provide plenty of room in front of the recovery vehicle to make the recovery
7. Allow some slack on the rope before making the vehicle recovery. Put the vehicle in first gear and apply the accelerator quickly. (The rope will Catapult the stuck vehicle out without a damaging shock). If needed, make a second attempt (wait three minutes between attempts to allow time for the rope to cool).
8. Clean the rope with a garden hose if needed before storing it away
