

# GROWING YOUR OWN CHERRY BLOSSOM TREE FROM SEED!

STEP-BY-STEP INSTRUCTIONS

1

BEFORE STARTING, HOT-SOAK YOUR SEEDS! BOIL WATER AND LET IT COOL FOR 10-15 MINUTES. ADD SEEDS, AND LET THEM SOAK FOR 24 HRS.

After pre-soaking your seeds for a day, you're ready to begin. First, remove the clear top cap from your mini-greenhouse, and pour in the bag of soil.

2

Next, gently add water to your mini-greenhouse until the soil is well-saturated. The soil does not need to be soggy, but does need to be wet through-and-through.

3

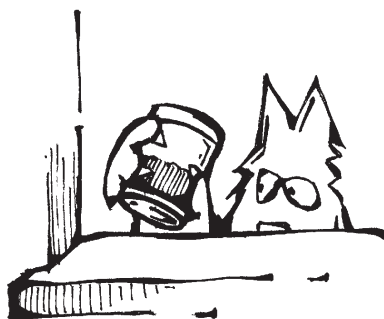

Now, it's time to sow your seeds! Simply pour the seeds into the mini-greenhouse. Then, empty the pouch of perlite (looks like white pebbles) directly over the seeds, and replace top cap.

4

Next, place your mini-greenhouse into the fridge, and leave it there for 30 DAYS. Time in this cold, damp, dark environment prepares the seeds for germination.

5

After 30 days, take your kit out of the fridge, and set it near a sunny window or in some other WARM place. This transition from cold to warm environment invites your seeds to wake up and grow!

6

HURRY UP AND WAIT FOR A FEW WEEKS!

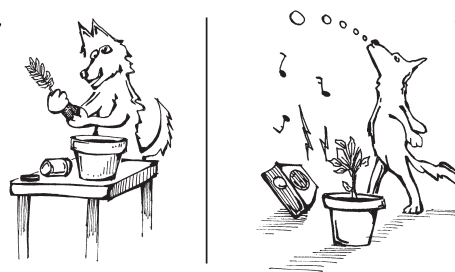

Now, it's time to play the waiting game, as your seeds prepare to sprout. During this waiting period, make certain your soil remains moist, but not soggy.

7

Eventually, the warmth your seeds are experiencing will cause them to germinate! When they sprout, remove the top cap of your mini-greenhouse to provide increased ventilation, which helps prevent molds. Move the sprout(s) to a slightly cooler, but still sunny location, keeping the soil just moist.

8

After some time, your baby tree(s) will outgrow the mini-greenhouse, and you will need to transplant to larger containers. Once adjusted to its new container, gradually work your tree(s) into a sunny outdoor location. Enjoy your tree as it develops, and let its soil dry out inbetween waterings. Fertilize with any high-nitrogen fertilizer, if you'd like.
