INSTALLATION GUIDE AND MANUAL

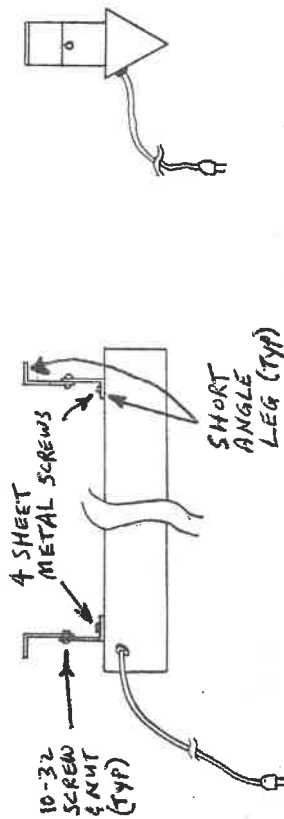

ADJUSTABLE MOUNTING BRACKET

Unpack the small white carton and note that there are four (4) angle pieces the same size. Within the small plastic bag, there should be four (4) 10-32 x $\frac{3}{4}$ " machine screws, four (4) 10-32 hex nuts, and four (4) lock washers.

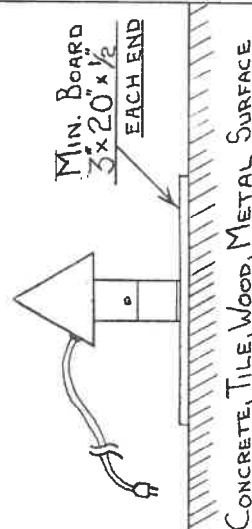

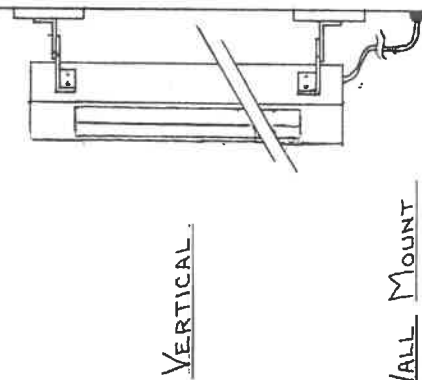

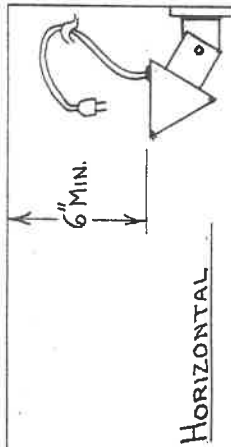

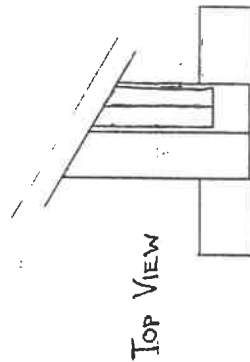

Remove the four (4) sheet metal screws on the heater body that are located towards the center of the heater and on the opposite side of the power cord. (see the illustration). Attached two (2) of the aluminum angles to the heater body using the sheet metal screws just removed. Position the short angle leg toward the center of the heater as shown. Attach the remaining two (2) aluminum angles to the angles just fastened to the body. Use the 10-32 screws (two for each angle) and 10-32 nuts with lock washers. Position the short angle leg toward the end of the heater body as shown. Tighten the screws and nuts with the angles positions straight or in line with each other.

Decide on the location of the heater. Position the heater where desired and, if practical, hold it in place while marking the bracket hole location on each end. If this is not easily done (as in the case of a large heater) then the hole locations must be measured and marked. Anchor the heater in place by the mounting bracket, using suitable fastener (wood screw, molly anchors, drywall screws, etc. depending on the construction of the mounting surface.) In the case of wall mounting where the wall is hollow except where the wood stuffs are located, it is recommended that a board of at least 5 (five) inches wide and or sufficient length to allow fastening to the stud and heater brackets be installed prior to attached the heater. With this arrangement, the heater brackets are not required to match the stud spacing and this is much more secure and solid than molly or plastic expanding.
